

Accelerated Math Notes  
Line and Angle Relationships  
(Section 11-1)

How do we classify angles?

Acute angles  $< 90^\circ$

Obtuse angles  $> 90^\circ$  and  $< 180^\circ$

Right angles  $90^\circ$

Straight angles  $180^\circ$

Reflex angles more than  $180^\circ$

How do we define an angle? Two rays with a common vertex

How do we name angles?

$\angle 1$

Complementary angles have a sum of  $90^\circ$

Supplementary angles have a sum of  $180^\circ$

Find the missing angle measure.

When two lines intersect, they form two pairs of opposite angles, called vertical angles. Vertical angles are congruent.

Two angles that have the same vertex between them, share a common side, and do not overlap are called adjacent angles.

- $\angle 1$  and  $\angle 2$
- $\angle 2$  and  $\angle 3$
- $\angle 3$  and  $\angle 4$
- $\angle 4$  and  $\angle 1$

$\angle ABD$  is adjacent to  $\angle DBC$

Sketch a picture of two angles that are adjacent, congruent, and complementary.

One angle is five times as large as another angle. If the angles are complementary, find the measures of both angles algebraically (write an equation and solve).

Let  $x = 1$  angle  
 $5x = \text{other angle}$   
 (sum =  $90^\circ$ )  
 $x + 5x = 90$   
 $6x = 90$   
 $\frac{6x}{6} = \frac{90}{6}$   
 $x = 15$

$5(15) = 75^\circ$

The eight angles formed by parallel lines and a transversal (a line that intersects two or more parallel lines) have special names.

Alternate interior angles  
 $\angle 8$  and  $\angle 4$   
 $\angle 7$  and  $\angle 3$

Alternate exterior angles  
 $\angle 2$  and  $\angle 6$   
 $\angle 1$  and  $\angle 5$

Corresponding angles  
 same side of transversal  
 have same position.

- $\angle 1$  and  $\angle 7$
- $\angle 2$  and  $\angle 4$
- $\angle 8$  and  $\angle 6$
- $\angle 3$  and  $\angle 5$

If two parallel lines are cut by a transversal, then

- \*corresponding angles are congruent
- \*alternate interior angles are congruent
- \*alternate exterior angles are congruent

Angles are congruent  $\angle 1 \cong \angle 2$

Measures of angles are equal  $m\angle 1 = m\angle 2$

↑  
measure of  $\angle 1$

Lines  $L_1$  and  $L_2$  are parallel.  $L_3$  is a transversal. Find the missing angle measures if  $m\angle 1 = 32^\circ$

- $\angle 1$  and  $\angle 7$  alt ext  $\angle$ s
- $\angle 1$  and  $\angle 3$  vertical
- $\angle 3$  and  $\angle 5$  alt int  $\angle$ s
- $\angle 1$  and  $\angle 2$  supplements
- $\angle 4$  and  $\angle 8$  corresponding
- $\angle 6$  and  $\angle 4$  are alt int  $\angle$ s

What do we know about these angle measures?

$$90^\circ = m\angle 11, m\angle 6, m\angle 4, m\angle 3, m\angle 5, m\angle 14$$

$$m\angle 9 + m\angle 10 = 90 \quad m\angle 12 + m\angle 13 = 90$$

$$m\angle 1 + m\angle 2 = 180$$

$$m\angle 7 = m\angle 9 \quad \text{alt int angles}$$

$$m\angle 7 + m\angle 6 + m\angle 10 = 180^\circ$$

Find these angle measures if we know that  $m\angle 9 = 30^\circ$

$$m\angle 9 = 30^\circ$$

$$m\angle 10 = 60^\circ$$

$$m\angle 11 = 90^\circ$$

$$m\angle 12 = 30^\circ$$

$$m\angle 13 = 60^\circ$$

$$m\angle 14 = 90^\circ$$

$$m\angle 1 = 30^\circ$$

$$m\angle 2 = 150^\circ$$

$$m\angle 3 = 90^\circ$$

$$m\angle 4 = 90^\circ$$

$$m\angle 5 = 90^\circ$$

$$m\angle 6 = 90^\circ$$

$$m\angle 7 = 30^\circ$$

$$m\angle 8 = 150^\circ$$
